

Original Hypothesis – X Variable is Independent

Null Hypothesis – Y Variable is Dependent Variable

True Relationship? – There is causality in both directions

Question – How can this data be used to quantifiably measure the nature of dual causality between Y and X?

Potential Answer? – The nature of the dual causality can be measured by the level the polynomial trend line is pulled away from the original hypothesis.

Polynomial Trend is pulled 40% toward the null hypothesis trend, therefore, the Y variable has ~40% of the influence on the X, and the Y has ~60% influence on the X.
